SEARCH REQUEST FORM

Scientific and Technical Information Center

Requester's Full Name: Igor Borissou Examiner #: 7775 Date: 10-22-07
 Art Unit: 2275 Phone Number 301-497-1000 Serial Number: 1000000000
 Mail Box and Bldg/Room Location: 1000 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: Process for analyzing biological data

Inventors (please provide full names): Igor E. Plotkin

Earliest Priority Filing Date: 10-1-00

**For Sequence Searches Only* Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.*

STAFF USE ONLY**Type of Search****Vendors and cost where applicable**

Treatment: Practical (P)

Abstract: Keeping track of manuscripts and reviewers in editorial offices can be a complex and time-consuming task, especially for offices that handle thousands of manuscripts annually. The American Chemical Society (ACS) has developed a computer-based system, called Peer Review Plus, which is used by editorial staff for tracking manuscripts, assigning reviewers, and generating statistical reports. The current software is a second generation system that required approximately 4 man-years to develop. The software centers around reviewer and author/manuscript files with a capacity of approximately 25000 author and reviewer records providing rapid record access via several file keys. The system permits office staff to quickly select appropriate reviewers for manuscripts in specific subdisciplines, check the status of manuscripts, identify overdue reviews, list manuscripts for a particular author, list manuscript processing time, identify lack-of-action bottlenecks for manuscripts, etc. Word-processing functions have been integrated with the Peer Review Plus software, and automated telecommunication facilities have been developed to permit unattended transfer of data in a networked environment. ABSTRACT: Although astronomers claim to be happy with the current system of peer review overall, dissatisfaction is expressed by many regarding the specifics of the process. The main complaints are that it is slow, that the responses of referees and authors can be ill-tempered, that controversial papers are blocked or ignored, and that some authors can get very poor work published. Many astronomers express the opinion that such problems can be overcome by the editors of science journals. Recently, there appears to be a trend toward a freer approach to the publication of manuscripts. More and more results are being published in the form of conference proceedings, abstracts, and press releases that have not been subjected to peer review. The Internet is also providing an unsupervised alternative to traditional journals.

TEXT:

In September the Astrophysical Journal Letters became the first major astronomical journal to go online. Its spiffy hypertext and fast turnaround time typify how the Internet is transforming academic publishing. Yet the question that vexes scientists most about the cyberjournals is an old one: how to maintain quality?

Traditionally, the answer has been peer review: When a researcher submits a paper to a journal, the editor asks an expert in the field to decide whether it should be published. The practice of peer review always manages to be at the heart of controversies in publishing. Can't keep up with the ever-expanding journals? Maybe peer reviews are letting through unworthy papers. The conventional wisdom stymies innovative research? Maybe peer reviews depend too heavily on experts' prejudices.

On the whole, astronomers say they're happy with the current system of peer review. But when it comes to specifics, many express dissatisfaction. Nearly everyone can relate a bad experience with the process. Caltech cosmologist Kip Thorne told us, "Although the peer review system is the best I know of, to a disconcerting degree it is a crapshoot."

Although the electronic Ap.J. maintains the traditional system of peer review, the Internet also offers the first real alternative: a laissez-faire system in which every paper gets published and everyone decides for himself or herself what is worthwhile. This and other ways to bypass peer review, such as conference proceedings and press releases, are gaining in popularity. Now that there is a way, there is a will.

YOU MAKE THE CALL

Scientists are always critiquing each other's work, but peer reviews formalize that interchange. A peer review begins when an author submits a manuscript to a journal and the editor asks someone else in the field to make the call: publish it, reject it, or suggest changes. As the first person to study the paper who (in principle) has no vested interest in it, the referee can spot errors that escape scientists with even the best of abilities and intentions.

The entire review system is voluntary. Reviewers are not paid for

their reviews , and they may decline to review a manuscript . Even so, most scientists are happy to take part, since they realize it is as important to be a critic as a creator.

When we informally polled 50 professional astronomers about peer review, we asked what they expect from a referee, and it's a lot:

Make sure the paper meets the standards of the journal.

Point out to the authors related papers they may not have known about.

Point out any errors in observing technique or theoretical argument.

Verify the bibliographic references.

Check the figures.

Point out which parts of the paper are out on a limb and need additional proof.

Make suggestions about the use of language.

Determine whether the work is original or a rehash of earlier work.

Our sources also told us the main thing they don't want a reviewer to do: agree or disagree with the results or the author's interpretation of them. Only the test of time, the use of the results by the community of scientists, can decide whether the ideas are not just plausible, but true.

So much for the theory. In practice, astronomers feel ambivalent about peer review. On the one hand, four out of five respondents to the 1990 American Astronomical Society membership survey said they were satisfied with the system. Compared with other disciplines, astronomy is remarkably contented. When the National Science Foundation asked its 1985 grant recipients whether they were satisfied with the peer review of their proposals, 38 percent said they were not. Two-thirds of the respondents agreed that the NSF is unlikely to fund high-risk, innovative research because its reviews are too conservative.

On the other hand, every astronomer you ask says that referees could do better. Our sources told of reviewers who procrastinated for months, who hurled insults at them, who blocked publication out of ignorance or spite, or who didn't bother to make any suggestions at all.

It's slow. The primary complaint about peer review is its slow pace. According to the AAS, publisher of the Astrophysical Journal, the average time for an author to receive a critique is supposed to be four weeks. But actual times to get a manuscript back from a referee can be as long as eight months -- an eternity in a field where the pace of discovery is so rapid. Out of desperation, Ap.J. associate editor Virginia Trimble said she has started keeping track of slow referees, and sending them each other's papers.

It's ill-tempered. A disconcerting number of referees and authors forget basic human courtesies. "I've seen a number of referee reports that are extremely vicious," Harvard astronomer John Huchra said. "There's almost never any cause for this unless the paper itself is nasty or vitriolic. Referees should be urged to be civil and watch standards, and authors should be urged to have patience with the referees if there are points of misunderstanding or miscommunication."

It's capricious. Reviewers are not supposed to block publication of controversial papers, but they do. "The peer review system is valuable, but it is certainly abused, and in particular is too strongly influenced by, or even controlled by, 'establishment science.' The system works reasonably well as long as new or controversial material is not involved," said William Tifft of the University of Arizona.

Thorne agreed: "During my 30 years in science, I have seen a handful of papers (mostly by colleagues) which turned out to be extremely important, which were rejected in the first round of refereeing."

Some reviewers refuse even to look at potentially controversial papers, and their abstention is as damning as any negative critique. Tifft, no stranger to controversy [see "A Brief History of Quantized Time," September/October, p. 12], has run into this. "One of my most recent papers on redshift quantization was sent to four different referees and none would review it," he said. "This leads to rejection by default."

Less determined authors emasculate their papers to get them past the reviewers. As Ethan Vishniac at the University of Texas said, "The easiest way to get a theory paper published is to write a paper that breaks no new

ground, contradicts no previous work, references everyone under the Sun, and includes only a straightforward calculation of a minor variation of previous models. No one will read such a paper, perhaps not even the referee, but it will boost the author's resume."

It's lenient. Other astronomers think that peer review fails to enforce the standards that scientific papers should meet. A famous, overbearing, or just plain obnoxious author can steamroll over editors and reviewers. "The current refereeing system fails in the most important way: It is virtually impossible to prevent a paper from being published in a refereed journal, no matter how poor the work is," one astronomer told us. Are we overburdening journals with contentless papers that nobody reads?

The statistics seem to back this up. According to Ap.J. editor Helmut Abt, of the 1039 papers submitted in 1984 to the Ap.J., Astronomical Journal, and Publications of the ASP, 90 percent were accepted. Of the rejected papers, a third were published elsewhere. The PASP had the highest rejection rate -- 12 percent. The planetary-science journal Icarus has higher rates of rejection, up to 30 percent. In other sciences, rejection rates exceed 50 percent.

Many astronomers argue that the high acceptance rate is good, for a variety of reasons. "Almost all papers contain material which ought to be part of the community data treasure trove," said Caty Pilachowski at Kitt Peak National Observatory. "Even if an author's conclusions are wrong, the data usually are not, and they can be of great value to someone else." Meg Urry of the Space Telescope Science Institute said it's better to accept dross than to risk rejecting brilliance. "I think we have to be prepared to accept lots of useless papers to get the occasional important one," she said.

A.J. editor Paul Hodge said that the acceptance rate is high because peer review is doing its job: helping authors to bring their papers up to par. "Our experience is that reviews cause a significant improvement in about 85 percent of the papers which get accepted," he said.

But Greg Bothun at the University of Oregon said the fraction of helpful reviews is more like 15 percent. He has kept informal statistics on the reviews of his papers, and he said that half the time the referee misunderstood the data or the arguments, thought the paper was on something else, or was in an enemy camp.

"I would like nothing better than to have my paper improved and broadened by a knowledgeable referee," Bothun said. "This rarely happens. Indeed, I can point to about 20 papers I have published that have received no referee's report at all save the words 'publish it.' That doesn't improve the quality of the paper very much."

Kristen Sellgren at Ohio State University is also cynical. "I think many reviewers don't read papers very carefully," she said. "I like to think the reviewer is the last line of defense against a bad mistake that I haven't caught, but often the reviews show little or no indication that the referee has thought about, understood, or even read the paper."

Sellgren's colleague Jay Frogel said he often shows his papers to colleagues in his department; the comments he receives from them are "more useful, more extensive, and more critical" than what he later gets from referees.

One thing is certain: Astronomers are under a great deal of pressure to publish. Job security and peer respect hinge on how many papers one can crank out. For this reason, it is hard to imagine that the volume of publication will go down unless the rejection rates go up. Icarus editor Joe Burns suggested that accepting a paper simply because it is correct is not good enough. "Editors should be able to defend why every article makes it into print," he said. "It's not enough just to say that I couldn't find anything wrong with it."

FIRM BUT FAIR

For many astronomers, the editor is the solution to the problems of peer review. Those we interviewed said editors should crack down on sluggish referees, replace misguided referees, double-check critiques, and stand firm when an author tries to bypass a referee's judgment. PASP editor Howard Bond said that he edits referee reports if they contain incorrect

statements or inappropriate remarks.

Editors must also counteract the tendency of peer review to homogenize publications. In principle, each journal has its own emphasis and tolerance for new ideas, giving authors the chance to pick the place where their paper belongs. In practice, because astronomy is a small field, different journals tend to call on the same referees. Abt said that, in the rare case where a paper has been rejected by one journal and sent to another, "one would be surprised at how often the new editor selects the same referee as did the old one." Preventing this takes some legwork on the editor's part, as Abt described: "When I know that a paper has been rejected by another journal, I find out from the journal's editor the name(s) of the rejecting referee(s) so that I can, for fairness, select a different person."

Most astronomers agree on the need for firm but fair editing, but they have yet to reach a consensus on other reforms. Take anonymity. In astronomy, the referee always knows who the author is, but not vice-versa. Should the author know the referee's identity (an open review)? Some say open reviews would improve accountability, while others say that reviewers need anonymity to speak freely. Should the author remain anonymous (a double-blind review)? Some say double-blinding would remove the unhealthy deference paid to top names, while others say that knowing the identity of the authors is important to judging their work.

In 1991, the American Economic Review conducted an experiment: They sent half of the incoming manuscripts to normal peer review, and the other half to double-blind peer review. The double-blind reviews were tougher and faster.

Increasing the number of reviewers is another possible reform. Icarus already sends each paper to two reviewers, and Ap.J. sends panned papers out for a second opinion. The extreme version of this would be review by a panel of experts sitting together in a room. The NSF Astronomy Division, which previously used only anonymous peer review, recently decided to experiment with panel review of grant proposals. No one we talked to mentioned panel review of papers.

Will tinkering fix peer review, or should astronomers consider a radically different system? James van Allen of the University of Iowa suggested two alternatives to peer review: nomination of papers by professional societies and elimination of peer review altogether. "One alternative is for a journal to accept only those papers that have been 'communicated' by established authorities, for instance, members of the National Academy of Sciences, or the Royal Astronomical Society," he said. "In effect, the communicator endorses the validity of the work and relieves the editor from further scrutiny of the submitted manuscripts. My own view is that this process, despite its merits, tends to be excessively authoritarian and may suppress fresh and daring departures from the prevailing paradigm."

THE WEALTH OF PAPERS

Van Allen's second alternative is a "free-for-all system (like the Internet) entirely dependent on the authors' competence and their willingness to stake their reputations on their manuscripts as written."

For better or worse, science is clearly heading for this laissez-faire approach. Many results first appear in unrefereed conference proceedings, abstracts, and press releases. The savvy recognize such information as to be used with extreme caution and as almost certain to change. Normally, the general public is not among the savvy. Astronomers worry, in particular, that NASA's press releases have overhyped Hubble Space Telescope findings. Front-page fame is certainly more appealing than running the gauntlet of colleagues trying to shoot down your theory, but it doesn't contribute much to the reliability of knowledge.

The Internet is the ultimate in unrefereed publishing. Not only is it easy to use -- no more hours wandering libraries or fighting Xerox machines -- it is cheap. Readers don't need to pay \$165 a year to subscribe; authors don't need to pay the \$100 a page that printed journals demand of

them. Bothun told us he may never publish another paper again. He puts his data on the World Wide Web for anyone to access, and saves a bundle. "I have published about 2,000 pages. That's about \$200,000 dumped into journals in the last 15 years," he said.

Would eliminating peer review change much? Perhaps not. Many reviews are ineffectual, almost all papers are accepted anyway, and only time can tell whether a paper is correct. Nonetheless, van Allen said he fears that widespread adoption of the laissez-faire system "would tend to undermine readers' confidence in published work and result in considerable chaos in most fields."

Peter Boyce, senior AAS associate, also said he worries about anarchy. "The concept of putting everything up for public comment has a seductive ring to it, but then everyone has to read everything, and who has time to do that? And whose public comments do you believe?" he asked.

Boyce leads the team that is putting the Ap.J. online. "I think that in the electronic environment it will be even more important to have good editing and good peer review," he said. "The problem will be to sort out the good stuff from the junk. The only defense I see against declining quality is to have responsible peer reviewing for the meaningful electronic journals. And that's what the AAS will be doing."

Nobody completely likes peer review, but in lieu of a clearly better alternative, most agree with Boyce. "Peer review is an essential ingredient in maintaining astronomy's high scientific standards while preserving an individual's ability to explore new or divergent ideas," Pilachowski said. Still, it is worrisome that those who sing the praises of peer review most vigorously tend to be well-established astronomers at name institutions. The others are more willing to experiment with alternatives. Will this rift widen, creating two tiers of publication? In some ways, it is already happening.

Perhaps the greatest benefit of technological change is the discussion it has provoked about peer review, and academic publishing in general. For years journals proliferated, librarians groaned, and nobody knew what to do. But the Internet is sweeping all before it. "The information superhighway is changing the publishing landscape," one astronomer observed. "The journals must embrace this new medium, or be made obsolete by it."

Abt said that, in the rare case where a paper has been rejected by one journal and sent to another, "one would be surprised at how often the new editor selects the same referee as did the old one." Preventing this takes some legwork on the editor's part, as Abt described: "When I know that a paper has been rejected by another journal, I find out from the journal's editor the name(s) of the rejecting referee(s) so that I can, for fairness, select a different person."

Most astronomers agree on the need for firm but fair editing, but they have yet to reach a consensus on other reforms. Take anonymity. In astronomy, the referee always knows who the author is, but not vice-versa. Should the author know the referee's identity (an open review)? Some say open reviews would improve accountability, while others say that reviewers need anonymity to speak freely. Should the author remain anonymous (a double-blind review)? Some say double-blinding would remove the unhealthy deference paid to top names, while others say that knowing the identity of the authors is important to judging their work.

In 1991, the American Economic Review conducted an experiment: They sent half of the incoming manuscripts to normal peer review, and the other half to double-blind peer review. The double-blind reviews were tougher and faster.

Increasing the number of reviewers is another possible reform. Icarus already sends each paper to two reviewers, and Ap.J. sends panned papers out for a second opinion. The extreme version of this would be review by a panel of experts sitting together in a room. The NSF Astronomy Division, which previously used only anonymous peer review, recently decided to experiment with panel review of grant proposals. No one we talked to mentioned panel review of papers.

Will tinkering fix peer review, or should astronomers consider a radically different system? James van Allen of the University of Iowa suggested two alternatives to peer review: nomination of papers by professional societies and elimination of peer review altogether. "One alternative is for a journal to accept only those papers that have been 'communicated' by established authorities, for instance, members of the National Academy of Sciences, or the Royal Astronomical Society," he said. "In effect, the communicator endorses the validity of the work and relieves the editor from further scrutiny of the submitted manuscripts. My own view is that this process, despite its merits, tends to be excessively authoritarian and may suppress fresh and daring departures from the prevailing paradigm."

THE WEALTH OF PAPERS

Van Allen's second alternative is a "free-for-all system (like the Internet) entirely dependent on the authors' competence and their willingness to stake their reputations on their manuscripts as written."

For better or worse, science is clearly heading for this laissez-faire approach. Many results first appear in unrefereed conference proceedings, abstracts, and press releases. The savvy recognize such information as to be used with extreme caution and as almost certain to change. Normally, the general public is not among the savvy. Astronomers worry, in particular, that NASA's press releases have overhyped Hubble Space Telescope findings. Front-page fame is certainly more appealing than running the gauntlet of colleagues trying to shoot down your theory, but it doesn't contribute much to the reliability of knowledge.

The Internet is the ultimate in unrefereed publishing. Not only is it easy to use -- no more hours wandering libraries or fighting Xerox machines -- it is cheap. Readers don't need to pay \$165 a year to subscribe; authors don't need to pay the \$100 a page that printed journals demand of

them. Bothun told us he may never publish another paper again. He puts his data on the World Wide Web for anyone to access, and saves a bundle. "I have published about 2,000 pages. That's about \$200,000 dumped into journals in the last 15 years," he said.

Would eliminating peer review change much? Perhaps not. Many reviews are ineffectual, almost all papers are accepted anyway, and only time can tell whether a paper is correct. Nonetheless, van Allen said he fears that widespread adoption of the laissez-faire system "would tend to undermine readers' confidence in published work and result in considerable chaos in most fields."

Peter Boyce, senior AAS associate, also said he worries about anarchy. "The concept of putting everything up for public comment has a seductive ring to it, but then everyone has to read everything, and who has time to do that? And whose public comments do you believe?" he asked.

Boyce leads the team that is putting the Ap.J. online. "I think that in the electronic environment it will be even more important to have good editing and good peer review," he said. "The problem will be to sort out the good stuff from the junk. The only defense I see against declining quality is to have responsible peer reviewing for the meaningful electronic journals. And that's what the AAS will be doing."

Nobody completely likes peer review, but in lieu of a clearly better alternative, most agree with Boyce. "Peer review is an essential ingredient in maintaining astronomy's high scientific standards while preserving an individual's ability to explore new or divergent ideas," Pilachowski said. Still, it is worrisome that those who sing the praises of peer review most vigorously tend to be well-established astronomers at name institutions. The others are more willing to experiment with alternatives. Will this rift widen, creating two tiers of publication? In some ways, it is already happening.

Perhaps the greatest benefit of technological change is the discussion it has provoked about peer review, and academic publishing in general. For years journals proliferated, librarians groaned, and nobody knew what to do. But the Internet is sweeping all before it. "The information superhighway is changing the publishing landscape," one astronomer observed. "The journals must embrace this new medium, or be made obsolete by it."

ABSTRACT: Although astronomers claim to be happy with the current system of peer review overall, dissatisfaction is expressed by many regarding the specifics of the process. The main complaints are that it is slow, that the responses of referees and authors can be ill-tempered, that controversial papers are blocked or ignored, and that some authors can get very poor work published. Many astronomers express the opinion that such problems can be overcome by the editors of science journals. Recently, there appears to be a trend toward a freer approach to the publication of manuscripts. More and more results are being published in the form of conference proceedings, abstracts, and press releases that have not been subjected to peer review. The Internet is also providing an unsupervised alternative to traditional journals.

TEXT:

In September the Astrophysical Journal Letters became the first major astronomical journal to go online. Its spiffy hypertext and fast turnaround time typify how the Internet is transforming academic publishing. Yet the question that vexes scientists most about the cyberjournals is an old one: how to maintain quality?

Traditionally, the answer has been peer review: When a researcher submits a paper to a journal, the editor asks an expert in the field to decide whether it should be published. The practice of peer review always manages to be at the heart of controversies in publishing. Can't keep up with the ever-expanding journals? Maybe peer reviews are letting through unworthy papers. The conventional wisdom stymies innovative research? Maybe peer reviews depend too heavily on experts' prejudices.

On the whole, astronomers say they're happy with the current system of peer review. But when it comes to specifics, many express dissatisfaction. Nearly everyone can relate a bad experience with the process. Caltech cosmologist Kip Thorne told us, "Although the peer review system is the best I know of, to a disconcerting degree it is a crapshoot."

Although the electronic Ap.J. maintains the traditional system of peer review, the Internet also offers the first real alternative: a laissez-faire system in which every paper gets published and everyone decides for himself or herself what is worthwhile. This and other ways to bypass peer review, such as conference proceedings and press releases, are gaining in popularity. Now that there is a way, there is a will.

YOU MAKE THE CALL

Scientists are always critiquing each other's work, but peer reviews formalize that interchange. A peer review begins when an author submits a manuscript to a journal and the editor asks someone else in the field to make the call: publish it, reject it, or suggest changes. As the first person to study the paper who (in principle) has no vested interest in it, the referee can spot errors that escape scientists with even the best of abilities and intentions.

The entire review system is voluntary. Reviewers are not paid for

their reviews, and they may decline to review a manuscript. Even so, most scientists are happy to take part, since they realize it is as important to be a critic as a creator.

When we informally polled 50 professional astronomers about peer review, we asked what they expect from a referee, and it's a lot:

Make sure the paper meets the standards of the journal.

Point out to the authors related papers they may not have known about.

Point out any errors in observing technique or theoretical argument.

Verify the bibliographic references.

Check the figures.

Point out which parts of the paper are out on a limb and need additional proof.

Make suggestions about the use of language.

Determine whether the work is original or a rehash of earlier work.

Our sources also told us the main thing they don't want a reviewer to do: agree or disagree with the results or the author's interpretation of them. Only the test of time, the use of the results by the community of scientists, can decide whether the ideas are not just plausible, but true.

So much for the theory. In practice, astronomers feel ambivalent about peer review. On the one hand, four out of five respondents to the 1990 American Astronomical Society membership survey said they were satisfied with the system. Compared with other disciplines, astronomy is remarkably contented. When the National Science Foundation asked its 1985 grant recipients whether they were satisfied with the peer review of their proposals, 38 percent said they were not. Two-thirds of the respondents agreed that the NSF is unlikely to fund high-risk, innovative research because its reviews are too conservative.

On the other hand, every astronomer you ask says that referees could do better. Our sources told of reviewers who procrastinated for months, who hurled insults at them, who blocked publication out of ignorance or spite, or who didn't bother to make any suggestions at all.

It's slow. The primary complaint about peer review is its slow pace. According to the AAS, publisher of the Astrophysical Journal, the average time for an author to receive a critique is supposed to be four weeks. But actual times to get a manuscript back from a referee can be as long as eight months -- an eternity in a field where the pace of discovery is so rapid. Out of desperation, Ap.J. associate editor Virginia Trimble said she has started keeping track of slow referees, and sending them each other's papers.

It's ill-tempered. A disconcerting number of referees and authors forget basic human courtesies. "I've seen a number of referee reports that are extremely vicious," Harvard astronomer John Huchra said. "There's almost never any cause for this unless the paper itself is nasty or vitriolic. Referees should be urged to be civil and watch standards, and authors should be urged to have patience with the referees if there are points of misunderstanding or miscommunication."

It's capricious. Reviewers are not supposed to block publication of controversial papers, but they do. "The peer review system is valuable, but it is certainly abused, and in particular is too strongly influenced by, or even controlled by, 'establishment science.' The system works reasonably well as long as new or controversial material is not involved," said William Tifft of the University of Arizona.

Thorne agreed: "During my 30 years in science, I have seen a handful of papers (mostly by colleagues) which turned out to be extremely important, which were rejected in the first round of refereeing."

Some reviewers refuse even to look at potentially controversial papers, and their abstention is as damning as any negative critique. Tifft, no stranger to controversy [see "A Brief History of Quantized Time," September/October, p. 12], has run into this. "One of my most recent papers on redshift quantization was sent to four different referees and none would review it," he said. "This leads to rejection by default."

Less determined authors emasculate their papers to get them past the reviewers. As Ethan Vishniac at the University of Texas said, "The easiest way to get a theory paper published is to write a paper that breaks no new

ground, contradicts no previous work, references everyone under the Sun, and includes only a straightforward calculation of a minor variation of previous models. No one will read such a paper, perhaps not even the referee, but it will boost the author's resume."

It's lenient. Other astronomers think that peer review fails to enforce the standards that scientific papers should meet. A famous, overbearing, or just plain obnoxious author can steamroll over editors and reviewers. "The current refereeing system fails in the most important way: It is virtually impossible to prevent a paper from being published in a refereed journal, no matter how poor the work is," one astronomer told us. Are we overburdening journals with contentless papers that nobody reads?

The statistics seem to back this up. According to Ap.J. editor Helmut Abt, of the 1039 papers submitted in 1984 to the Ap.J., Astronomical Journal, and Publications of the ASP, 90 percent were accepted. Of the rejected papers, a third were published elsewhere. The PASP had the highest rejection rate -- 12 percent. The planetary-science journal Icarus has higher rates of rejection, up to 30 percent. In other sciences, rejection rates exceed 50 percent.

Many astronomers argue that the high acceptance rate is good, for a variety of reasons. "Almost all papers contain material which ought to be part of the community data treasure trove," said Caty Pilachowski at Kitt Peak National Observatory. "Even if an author's conclusions are wrong, the data usually are not, and they can be of great value to someone else." Meg Urry of the Space Telescope Science Institute said it's better to accept dross than to risk rejecting brilliance. "I think we have to be prepared to accept lots of useless papers to get the occasional important one," she said.

A.J. editor Paul Hodge said that the acceptance rate is high because peer review is doing its job: helping authors to bring their papers up to par. "Our experience is that reviews cause a significant improvement in about 85 percent of the papers which get accepted," he said.

But Greg Bothun at the University of Oregon said the fraction of helpful reviews is more like 15 percent. He has kept informal statistics on the reviews of his papers, and he said that half the time the referee misunderstood the data or the arguments, thought the paper was on something else, or was in an enemy camp.

"I would like nothing better than to have my paper improved and broadened by a knowledgeable referee," Bothun said. "This rarely happens. Indeed, I can point to about 20 papers I have published that have received no referee's report at all save the words 'publish it.' That doesn't improve the quality of the paper very much."

Kristen Sellgren at Ohio State University is also cynical. "I think many reviewers don't read papers very carefully," she said. "I like to think the reviewer is the last line of defense against a bad mistake that I haven't caught, but often the reviews show little or no indication that the referee has thought about, understood, or even read the paper."

Sellgren's colleague Jay Frogel said he often shows his papers to colleagues in his department; the comments he receives from them are "more useful, more extensive, and more critical" than what he later gets from referees.

One thing is certain: Astronomers are under a great deal of pressure to publish. Job security and peer respect hinge on how many papers one can crank out. For this reason, it is hard to imagine that the volume of publication will go down unless the rejection rates go up. Icarus editor Joe Burns suggested that accepting a paper simply because it is correct is not good enough. "Editors should be able to defend why every article makes it into print," he said. "It's not enough just to say that I couldn't find anything wrong with it."

FIRM BUT FAIR

For many astronomers, the editor is the solution to the problems of peer review. Those we interviewed said editors should crack down on sluggish referees, replace misguided referees, double-check critiques, and stand firm when an author tries to bypass a referee's judgment. PASP editor Howard Bond said that he edits referee reports if they contain incorrect

statements or inappropriate remarks.

Editors must also counteract the tendency of peer review to homogenize publications. In principle, each journal has its own emphasis and tolerance for new ideas, giving authors the chance to pick the place where their paper belongs. In practice, because astronomy is a small field, different journals tend to call on the same referees. Abt said that, in the rare case where a paper has been rejected by one journal and sent to another, "one would be surprised at how often the new editor selects the same referee as did the old one." Preventing this takes some legwork on the editor's part, as Abt described: "When I know that a paper has been rejected by another journal, I find out from the journal's editor the name(s) of the rejecting referee(s) so that I can, for fairness, select a different person."

Most astronomers agree on the need for firm but fair editing, but they have yet to reach a consensus on other reforms. Take anonymity. In astronomy, the referee always knows who the author is, but not vice-versa. Should the author know the referee's identity (an open review)? Some say open reviews would improve accountability, while others say that reviewers need anonymity to speak freely. Should the author remain anonymous (a double-blind review)? Some say double-blinding would remove the unhealthy deference paid to top names, while others say that knowing the identity of the authors is important to judging their work.

In 1991, the American Economic Review conducted an experiment: They sent half of the incoming manuscripts to normal peer review, and the other half to double-blind peer review. The double-blind reviews were tougher and faster.

Increasing the number of reviewers is another possible reform. Icarus already sends each paper to two reviewers, and Ap.J. sends panned papers out for a second opinion. The extreme version of this would be review by a panel of experts sitting together in a room. The NSF Astronomy Division, which previously used only anonymous peer review, recently decided to experiment with panel review of grant proposals. No one we talked to mentioned panel review of papers.

Will tinkering fix peer review, or should astronomers consider a radically different system? James van Allen of the University of Iowa suggested two alternatives to peer review: nomination of papers by professional societies and elimination of peer review altogether. "One alternative is for a journal to accept only those papers that have been 'communicated' by established authorities, for instance, members of the National Academy of Sciences, or the Royal Astronomical Society," he said. "In effect, the communicator endorses the validity of the work and relieves the editor from further scrutiny of the submitted manuscripts. My own view is that this process, despite its merits, tends to be excessively authoritarian and may suppress fresh and daring departures from the prevailing paradigm."

THE WEALTH OF PAPERS

Van Allen's second alternative is a "free-for-all system (like the Internet) entirely dependent on the authors' competence and their willingness to stake their reputations on their manuscripts as written."

For better or worse, science is clearly heading for this laissez-faire approach. Many results first appear in unrefereed conference proceedings, abstracts, and press releases. The savvy recognize such information as to be used with extreme caution and as almost certain to change. Normally, the general public is not among the savvy. Astronomers worry, in particular, that NASA's press releases have overhyped Hubble Space Telescope findings. Front-page fame is certainly more appealing than running the gauntlet of colleagues trying to shoot down your theory, but it doesn't contribute much to the reliability of knowledge.

The Internet is the ultimate in unrefereed publishing. Not only is it easy to use -- no more hours wandering libraries or fighting Xerox machines -- it is cheap. Readers don't need to pay \$165 a year to subscribe; authors don't need to pay the \$100 a page that printed journals demand of

them. Bothun told us he may never publish another paper again. He puts his data on the World Wide Web for anyone to access, and saves a bundle. "I have published about 2,000 pages. That's about \$200,000 dumped into journals in the last 15 years," he said.

Would eliminating peer review change much? Perhaps not. Many reviews are ineffectual, almost all papers are accepted anyway, and only time can tell whether a paper is correct. Nonetheless, van Allen said he fears that widespread adoption of the laissez-faire system "would tend to undermine readers' confidence in published work and result in considerable chaos in most fields."

Peter Boyce, senior AAS associate, also said he worries about anarchy. "The concept of putting everything up for public comment has a seductive ring to it, but then everyone has to read everything, and who has time to do that? And whose public comments do you believe?" he asked.

Boyce leads the team that is putting the Ap.J. online. "I think that in the electronic environment it will be even more important to have good editing and good peer review," he said. "The problem will be to sort out the good stuff from the junk. The only defense I see against declining quality is to have responsible peer reviewing for the meaningful electronic journals. And that's what the AAS will be doing."

Nobody completely likes peer review, but in lieu of a clearly better alternative, most agree with Boyce. "Peer review is an essential ingredient in maintaining astronomy's high scientific standards while preserving an individual's ability to explore new or divergent ideas," Pilachowski said. Still, it is worrisome that those who sing the praises of peer review most vigorously tend to be well-established astronomers at name institutions. The others are more willing to experiment with alternatives. Will this rift widen, creating two tiers of publication? In some ways, it is already happening.

Perhaps the greatest benefit of technological change is the discussion it has provoked about peer review, and academic publishing in general. For years journals proliferated, librarians groaned, and nobody knew what to do. But the Internet is sweeping all before it. "The information superhighway is changing the publishing landscape," one astronomer observed. "The journals must embrace this new medium, or be made obsolete by it."
